# Challenges in Web3 Onboarding

**Non-technical users find onboarding intimidating and confusing due to complex processes.**

Getting a normal person onto a blockchain is hard — wallets, seed phrases, gas fees, test net faucets. Every one of those is a place people quit. And the way we usually teach Web3 is passive.

Meanwhile, casual word games — think Wordle — have proven that hundreds of millions of people will happily open a word puzzle every single day. Nobody has combined that habit with a real on-chain action. So onboarding funnels leak, and massive gaming audiences never even get exposed to blockchain.

Many potential users feel overwhelmed by wallets, seed phrases, and other unfamiliar terms . We hand people documentation and videos, but we never actually put a wallet in their hand and let them make a safe, low-stakes first transaction.

Existing education content lacks engagement, making it difficult for users to experience blockchain interactions and leading to high drop-off rates in onboarding funnels.

# Word Scramble

## Drag-and-drop puzzle

The **Word Scramble** game features Soroban contracts that facilitate real on-chain transactions. With multi-wallet support and a guided walkthrough, users can easily connect and play. A live event stream enhances engagement by showcasing real-time player activity, making the onboarding experience interactive and fun.

# The intersection of casual gamers and Web3 newcomers presents a unique opportunity for mass adoption and engagement.

## Casual Market

- Casual game markets are massive, driving daily engagement and attracting a broad user base across demographics.
- Proven success of games like Wordle highlights opportunities for real on-chain interactions to enhance user experience.

## Financial Inclusion

- Stellar focuses on financial inclusion, lowering barriers for non-technical users to engage in the blockchain space.

# Fully Client-Side Application

## Overview

This application is designed to be fully client-side, using vanilla HTML, CSS, and JavaScript, ensuring **seamless user experiences** without backend dependencies.

## Technical Details

The architecture leverages stellar.js to connect the UI with Soroban contracts, while event polling facilitates real-time updates. Continuous integration and analytics enhance performance tracking without user disruption.

# User Acquisition and Retention Strategies

## Recruitment Loop

A proven loop from wallet connect to on-chain submit — scaled 10 → 51 verified users, 182 on-chain transactions, 100% independently verified.

## Built-in Feedback

Continuous improvement encouraged through auto-prompts and persistent feedback options after user interactions.

## Retention Mechanics

Speedrun and Weekly Arena modes cater to diverse player interests, driving repeat engagement and competition.

## Long-Horizon Growth

On-chain badges as verified skill proof open avenues for school tournaments and community engagement initiatives.

FEEDBACK → ROADMAP

# Feedback Future Roadmap

Shipped straight from player feedback: a clearer Definition button, plus Scramble Board v2.0.0 — the 2–4 player 15×15 board users asked for. Next on the roadmap: an on-chain daily leaderboard with streaks and commit-reveal fairness, seasons and player profiles, a timed Speedrun mode, and long-term, verifiable on-chain vocabulary credentials for schools.

## User Engagement Metrics

51 verified users ·  
182 on-chain txns

4.8/5
